

Background

- Alzheimer's and Related Dementia (ARD) is the sixth leading cause of death, however only 45% of those affected receive a diagnosis (Rosenbloom et al., 2016).
- Major contributing factors to this faulty detection and diagnosis are: knowledge deficit, attitudes of healthcare providers, patient-provider communication, existing ARD education programs are optional (Raphael, 2022).
- 82% of primary care physicians are involved in dementia care provision, but few are confident in their capabilities of caring for ARD patients. Nearly 2 in 5 report they are "never" or only "sometimes comfortable" making an ARD diagnosis (Alzheimer's Association, 2020).
- The Latino population is rapidly growing and currently
